Function

The Jetnozzle system usually offers the ideal solution to ventilation problems in large premise specially for the underground car parking lots, due to a high number of air changes in the occupied lone. The ventilation air is directed by small jets of air from special nozzles to the places where it is needed, e.g. where more air movement is required.

Jet nozzle (Model: JIN-80)

General Description

The Jetvent System has been developed primarily to ventilate underground parking lot. The system is a successor to the conventional duct system. It is popular ventilation for the underground parking Lot. The Jetvent system features easy of construction, compact size and enhanced fan efficiency while retaining the excellent features, know-how and advantages of the Jet-nozzle System.

A high speed air jet blown from the nozzle increases in volume as it induces the ambient air while losing velocity as it goes away from the nozzle. It is the law of conservation of the momentum. Fresh air induced and transported according to the principle. Other fan units are installed within reach of the first air jet so that fresh air is eventually carried forward to the necessary part of. or throughout. a fan casing without using duct. If the layout of a garage is changed. for example. the ventilation system can be adopted to the new layout simply by adjusting the direction of nozzle or adding fan units as required.

(Fig-1) System Flow

Features

- Ductless

No ducts are used and the construction is quite easy. The Jetvent Fan units are simply installed at suitable place.
- Air Blown Direction

Nozzle direction can be varied. The most suitable variation is selected according to the shape of the building and application. A single Jetvent Fan unit can create a main air stream and eliminate air stagnation in the underground parking lot. The units can be arranged neatly because there is no need to align the unit with the direction of the air stream.
- Simple to Install

The Jetvent Fan units are simply suspended from the ceiling with hanger bolts.
- Ultra Thin

Very Thin fans are used. The Jetvent Fan unit. only 670mm high included hanging bracket for the Single Nozzle. The Multi Nozzle fans have 280mm height which included the universal and fan cabinet
- Energy Saving

No energy loss due to ducts. The air flow going through supply and exhaust fans can be easily controlled to ventilate because of dilution and diffusion.
- Low Noise

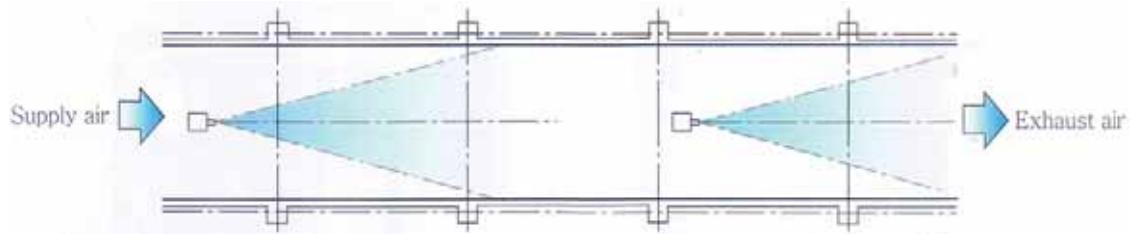

The Jetvent Fan unit incorporates a small sized mixed flow fan with a lower noise level. The noise is 55dB(A) at 1.5 meter from the unit.
- Maintenance Free

The lubrication free motor bearings require no maintenance.
- Electrical Power Source

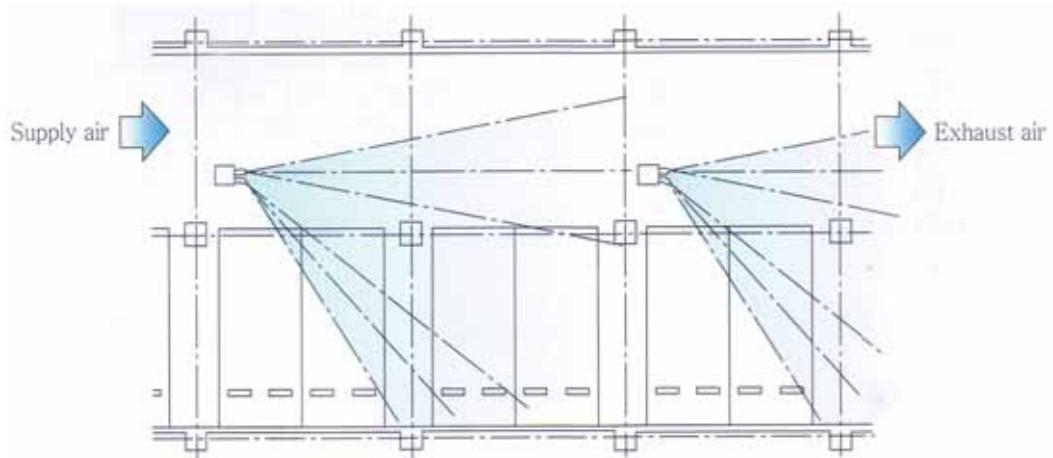

Electric wiring is simple because the power source is IPh x 220Volts 50/60Hz

System Layout

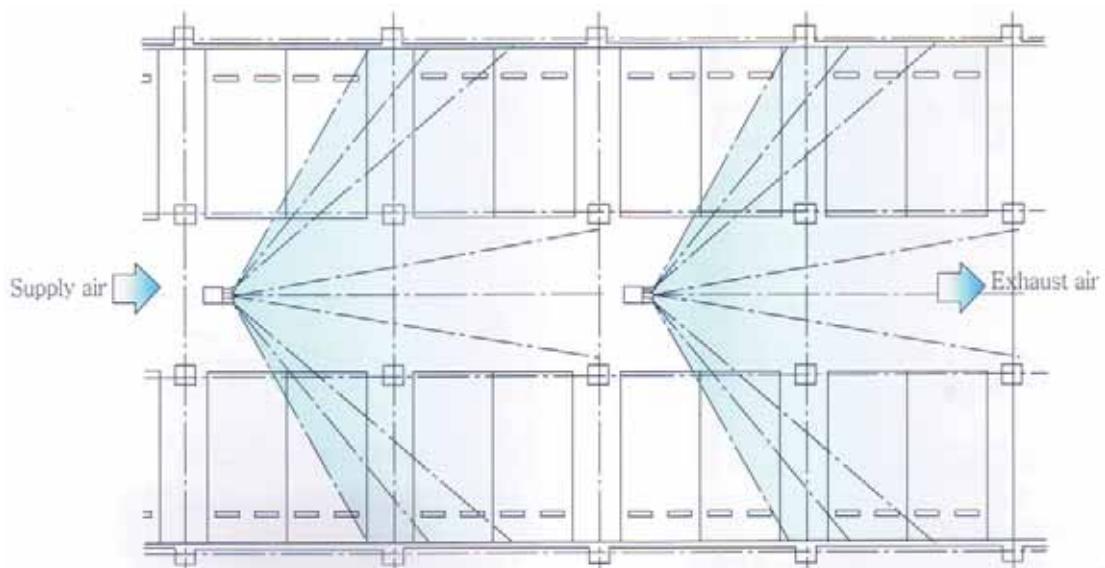

1) Single Nozzle (For passage only)

2) Double Nozzle (For passage and parking area)

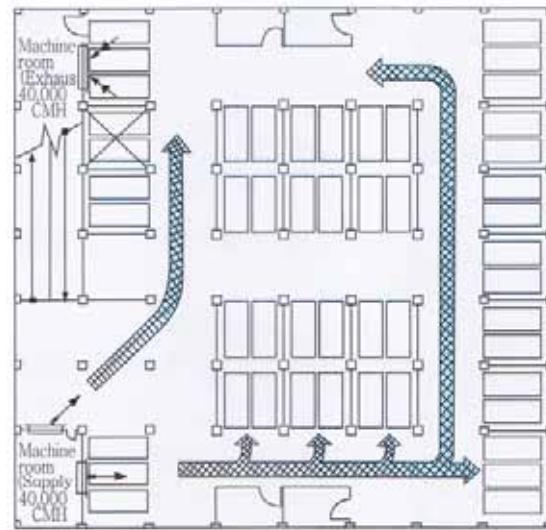

3) Triple Nozzle (For passage and both parking area)

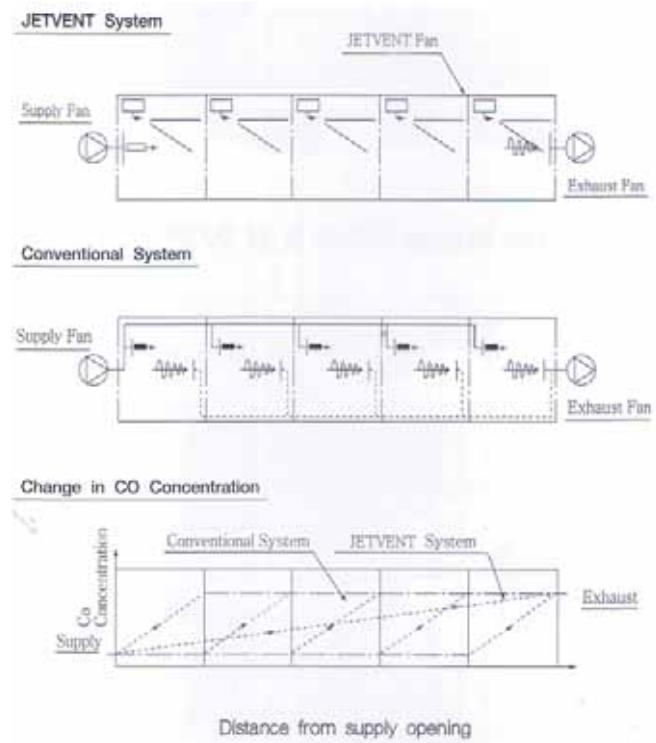

System Analysis

Item	Description
System	Overall air moving
Efficiency	Contaminants air diluted quickly by large quantity of air movement
Affect	Contaminants affect in the blown stream side
Installation	Easy to install
Composed	Compact moduled fan unit to be installed depends on covered area
Space	Ductless slim fan makes low ceiling to save building cost
Noise	Rather low noise
Cost	Inexpensive

ISOVEL Profile

Linevent Fan

Feature

- Wide ventilation effect due to long impeller
- Draft free due to medium tip velocity required
- Maintenance free due to lubrication free
- Easy Installation
- Energy saving

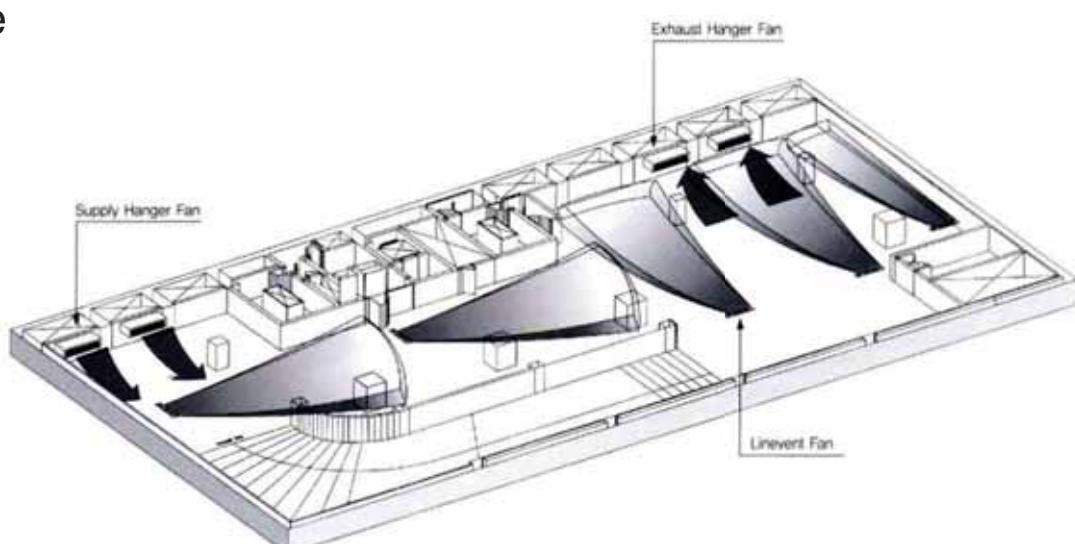

Application

- Under ground car parking lots
- Air curtain purpose
- To prevent condensation
